SUMMARY

Senior Software Engineer with 6+ years of experience building scalable full-stack applications using TypeScript, React, Next.js, and Node.js. Expertise in designing distributed systems, GraphQL APIs, and high-performance backend architectures. Proven ability to lead end-to-end feature development, optimize system performance, and deliver production-ready solutions serving 200,000+ users.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, SQL, Rust, C#, Java

Frontend: React, Next.js, React Native, Tailwind CSS, Three.js, Framer Motion

Backend: Node.js, GraphQL, tRPC, REST APIs, Express, Prisma ORM, PostgreSQL, Redis, BullMQ, Elasticsearch

Infrastructure & Cloud: AWS (Lambda, Elastic Beanstalk, S3), Docker, CI/CD, Vercel, PM2

Concepts: System Design, Distributed Systems, API Design, Microservices, Caching Strategies, Performance Optimization, Scalability, Technical Mentorship

EXPERIENCE

Keywords: TypeScript, React, Next.js, Node.js, GraphQL, PostgreSQL, AWS, Redis, System Design, APIs, Scalability

American Poolplayers Association (Remote) Feb 2021 – Present

Senior Software Engineer

- Led end-to-end development of core platform features supporting 200,000+ active users across league play, tournament management, and internal operations
- Drove architectural decisions across frontend and backend systems, improving scalability and maintainability of high-traffic applications
- Reduced critical endpoint latency by up to 77% and improved overall system responsiveness by ~20% through advanced query optimization, indexing strategies, multi-layer caching, and re-architecting idempotency handling to significantly reduce database load and improve request throughput
- Spearheaded frontend performance improvements by eliminating unnecessary re-renders and restructuring component architecture, resulting in significantly faster load times and improved mobile responsiveness
- Mentored engineers through code reviews, system design guidance, and enforcing modern development standards across the team
- Partnered with product and stakeholders to translate ambiguous requirements into scalable technical solutions

HuntNHook 2025 – Present

Co-Founder / Lead Engineer

- Architected and built a two-sided marketplace for outdoor experiences (fishing, hunting, recreation), owning all technical decisions from schema design to production deployment
- Designed and implemented a full Stripe Connect payment system including escrow-style holds, delayed payouts, dispute handling, and idempotent webhook processing
- Built geospatial search using PostGIS with efficient bounding-box queries, distance sorting, and multi-dimensional filtering
- Designed distributed system architecture using PM2 clustering, BullMQ worker queues, and Redis Pub/Sub for real-time GraphQL subscriptions across instances
- Implemented a multi-layer caching strategy with intelligent invalidation to support scalable, low-latency data access patterns
- Established production-ready infrastructure and deployment workflows for a scalable marketplace platform

PROJECTS

Rafa Sauna — Full-Stack Platform (Contract) 2025

- Designed and delivered a full-stack booking, membership, and POS platform, including admin dashboard, customer-facing flows, and kiosk systems
- Built NFC-based payment system using JWT-backed wristbands, enabling seamless contactless transactions across devices
- Architected a custom booking engine supporting capacity constraints, dynamic pricing, and real-time availability management
- Integrated Stripe for subscriptions, one-time payments, Apple Pay, refunds, and promotions
- Delivered a production-ready system spanning web, mobile, and kiosk environments

Construction Automation Platform — Contract 2025

- Engineered an internal automation system by reverse-engineering a closed third-party API to enable programmatic data entry and workflow automation
- Automated high-volume operational tasks (20+ daily records), reducing manual workload and improving data accuracy
- Built pipeline-to-invoice synchronization logic, transforming operational data into structured financial outputs
- Implemented headless browser automation using Puppeteer on AWS Lambda for unsupported workflows

EDUCATION

Lambda School — Full Stack Web Development

Sierra College — Computer Science
